

The following table shows the results of the regression analysis. The dependent variable is the number of days of absence from work due to illness. The independent variables are the age, sex, and education of the respondent, and the number of children in the household. The results show that the number of days of absence from work due to illness is positively related to the age of the respondent, the sex of the respondent (female), and the number of children in the household. The results also show that the number of days of absence from work due to illness is negatively related to the education of the respondent.
